Good exposures of the veins are often present in the working limestone quarries of the area. Try adding this search to your want list. WaterandhydrothermalfluidsonEarth2. On Earth, sites of hydrothermal activity support varied ecosystems based on a range of chemotrophic microorganisms both at surface and in the subsurface. Various models to account for hydrothermal fluid evolution have been proposed over the years, one being the convective circulation of seawater which upon heating is able to leach metals from the strata it passes. The deposits are hosted in limestone or dolomite that was deposited on shallow seafloors. The formation of these deposits includes interactions between seawater and its geological surroundings to initiate and drive processes that are of major importance to the dynamics and livelihood of our planet.
